**[Note]**

- Frequent write command executions by an NV memory write command may damage the NV memory.  
Therefore, it is recommended to limit writing the commands into the NV memory to less than 10 times a day.
  - If the power is turned off or the printer is reset via an interface while this command is being executed, the printer may go into an abnormal condition. Be careful not to turn the power off or let the printer be reset via an interface while this command is being executed.
  - While processing this command, the printer is BUSY while writing the data to the NV memory and stops receiving data. Therefore, be sure not to transmit data, including the real-time commands, while the printer is BUSY.
  - When <Function 48, 51, or 64> is transmitted, do not transmit the subsequent data until the status is received. ESC/POS Handshaking Protocol procedures are required when using <Function 64>.

**[Note]**

- Frequent write command executions by an NV memory write command may damage the NV memory. Therefore, it is recommended to limit writing the commands into the NV memory to less than 10 times a day.
- If the power is turned off or the printer is reset via an interface while this command is being executed, the printer may go into an abnormal condition. Be careful not to turn the power off or let the printer be reset via an interface while this command is being

executed.

- While processing this command, the printer is BUSY while writing the data to the NV memory and stops receiving data. Therefore, be sure not to transmit data, including the real-time commands, while the printer is BUSY.
- When <Function 1, 6, or 12> is transmitted, the data following must not be transmitted until the status is received.

Example: Graphic data might include this command.
  - Transmit this command using the following method:
    - When this command is transmitted, the subsequent data must not be transmitted until the status is received.
    - However, if this command must be transmitted continuously, it is possible to transmit up to 4 commands at once.  
In this case, the subsequent data must not be transmitted until the all status is received.  
If this command is transmitted without using the above method, the status may not be received.
